

NETWORK EDITION*

The following advanced features are incorporated in the network edition of TrialDirector 6:

- › Introduces application virtualization, which allows the application to run exclusively from the server.
- › Client workstation deployment has a minimal footprint and by default, deploys only a few files to the client workstation.
- › Silent client workstation deployment available using Windows Installer command line switches or Active Directory Group Policy.
- › New virtualization technology eliminates DLL/OCX conflicts with other applications and provides full compatibility with local (mobile) editions of TrialDirector 6.
- › Updates and patches need only be applied to the network server, eliminating the need for the administrator to redeploy each network client.
- › Client installation is a fully compliant Windows Installer MSI file type. The “InstallClient.msi” can be pushed in a mass deployment method using Active Directory, Microsoft Systems Management Server (aka SMS) or other application management software.
- › Network server installations can be performed from either an administrative workstation to the server, or directly on the server itself, eliminating the need to keep the admin workstation intact to administer the network server installation.
- › Compatible with both 32-bit and 64-bit versions of Windows XP, Windows Vista and Windows 7 operating systems.
- › Network client can reside on the same system that standalone licenses of version 5.x and/or 6 are installed.
- › Version 5.x and 6 network clients can reside on the same PC.
